One of the greatest innovations of the world wide web is that it makes information from all around the world accessible, interoperable, and useful in new and amazing ways. Facilitating part of this are Application Programming Interfaces (APIs), which create a set of functions and rules that can be used to access functions or data from other applications anywhere on the web. The use of APIs in law could help improve access to law and legal information, improve clarity and transparency for legal processes, build integrations for data-driven regulations and legal services, and move toward a more computational model for law.
